For example, if a person walks $\frac{1}{2}$ mile in each $\frac{1}{4}$ hour, compute the unit rate as the complex fraction $(\frac{1}{2})/(\frac{1}{4})$ miles per hour (interpreting a complex fraction as division of fractions), equivalently 2 miles per hour.	-Compute Unit Rates

7.RP.2b	Analyze a table or graph and recognize that, in a proportional relationship, every pair of numbers has the same unit rate (referred to as the “m”).	-Find, Show Proportional Amounts

Expressions and Equations: 7.EE - Use properties of operations to generate equivalent expressions.			
7.EE.1	Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients. Note: factoring is limited to integer coefficients. For example: apply the distributive property to the expression $24x+18y$ to produce the equivalent expression $6(4x+3y)$.	-Generate Equivalent Expressions	
7.EE.2	Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. For example, $a+0.05a=1.05a$ means that "increase by 5%" is the same as "multiply by 1.05."	-Generate Equivalent Expressions	
Expressions and Equations: 7.EE - Solve real-life and mathematical problems using numerical and algebraic expressions and equations.			
7.EE.3	Solve multi-step real-life and mathematical problems with rational numbers. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. For example: If a woman making \$25 an hour gets a 10% raise, she will make an additional $\frac{1}{10}$ of her salary an hour, or \$2.50, for a new salary of \$27.50	-Multi-Step, Real-World Problems	
7.EE.4	Use variables to represent quantities in a real-world or mathematical problem, and construct two-step equations and inequalities to solve problems by reasoning about the quantities.	-Solving Equations -Solving Inequalities	
7.EE.4a	Solve word problems leading to equations of the form $px+q=r$, and $p(x+q)=r$ where p , q , and r are specific rational numbers. Solve equations of these forms fluently (efficiently, accurately, and flexibly). Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. For example, perimeter of a rectangle is 54cm, length is 6cm. What's its width?	-Solving Equations	
7.EE.4b	Solve word problems leading to inequalities of the form $px+q>r$ or $px+q<r$ where p , q , r are specific rational numbers and $p>0$. Graph the solution set of the inequality interpret it in context. For example: As a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the number of sales you need to make, describe the solutions.	-Solving Inequalities

Geometry: 7.G - Draw, construct, and describe geometrical figures, and describe the relationships between them.			
7.G.1	Solve problems involving scale drawings of geometric figures, such as computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale.		
7.G.2	Identify three-dimensional objects generated by rotating a two-dimensional (rectangular or triangular) object around one edge.		
7.G.3	Describe the two-dimensional figures that result from slicing three-dimensional figures, as in plane sections of right rectangular prisms/right cylinder.		
Geometry: 7.G - Solve mathematical problems and problems in real-world context involving angle measure, area, surface area, and volume.			
7.G.4	Use the formulas for the area and circumference of a circle and solve problems; give an informal derivation of the relationship between the circumference and area of a circle.		
7.G.5	Investigate the relationship between three-dimensional geometric shapes;		
7.G.5a	Generalize the volume formula for prisms and cylinders ($V=Bh$ where B is the area of the base and h is the height).		
7.G.5b	Generalize the surface area formula for prisms and cylinders ($SA=2B+Ph$ where B is the area of the base, P is the perimeter of the base, and h is the height (in the case of a cylinder, perimeter is replaced by circumference)).		
7.G.6	Solve real-world/mathematical problems involving area of two-dimensional objects and volume and surface area of three-dimensional objects including cylinders and right prisms. (Solutions should not require students to take square roots or cube roots. For example, given the volume of a cylinder and the area of the base, students would identify the height.)		
Statistics and Probability: 7.SP - Use random sampling to draw inferences about a population.			
7.SP.1	Use statistics to gain information about a population by examining a sample of the population;	-Inferential Statistics	
7.SP.1a	Know that generalizations about a population from a sample are valid only if the sample is representative of that population; generate a valid representative sample of a population.	-Inferential Statistics	

KS Code	Kansas Standard	Quest Title	Small Group Skill Lesson
7.SP.1b	Identify if a particular random sample would be representative of a population; justify your reasoning.	-Inferential Statistics	
7.SP.2	Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to informally gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be.	-Inferential Statistics	

Statistics and Probability: 7.SP - Draw informal comparative inferences about two populations.

7.SP.3	Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability (requires introduction of mean absolute deviation). For example, the mean height of players on the basketball team is 10 cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable.		
7.SP.4	Use measures of center (mean, median and/or mode) measures of variability (range, interquartile range/mean absolute deviation) for numerical data from random samples to draw informal comparative inferences about two populations. For example, decide whether words in a chapter of a seventh-grade science book are generally longer than the words in a chapter of a fourth-grade science book.	-Measures of Central Tendency	

Statistics and Probability: 7.SP - Investigate chance processes and develop, use and evaluate probability models.

7.SP.5	Express the probability of a chance event as a number between 0 and 1 that represents likelihood of the event occurring. (Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around 1/2 indicates an event that is neither unlikely nor likely, a probability near 1 indicates a likely event.)	-Probability of a Chance Event	
--------	--	--------------------------------	--

KS Code	Kansas Standard	Quest Title	Small Group Skill Lesson
7.SP.6	Collect data from a chance process (probability experiment). Approximate the probability by observing long-run relative frequency. Recognize that as the number of trials increase, experimental probability approaches the theoretical probability. Conversely, predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times.	-Predict and Compare Probability	
7.SP.7	Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if agreement is not good, explain possible sources of discrepancy.	-Predict and Compare Probability	
7.SP.7a	Develop a uniform probability model by assigning equal probability to all outcomes, and use the model to determine probabilities of events. For example, if a student is selected at random from a class, find probability that Jane will be selected and the probability that a girl will be selected.	-Predict and Compare Probability	
7.SP.7b	Develop a probability model (which may not be uniform) by observing frequencies in data generated from a chance process. For example, find the approximate probability that a spinning penny will land heads up or that a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear to be equally likely based on the observed frequencies?	-Predict and Compare Probability	
7.SP.8	Find probabilities of compound events using organized lists, tables, tree diagrams, simulation.	-Probabilities of Compound Events	
7.SP.8a	Know that, just as with simple events, probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs.	-Probabilities of Compound Events	
7.SP.8b	Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g. "rolling double sixes"), identify the outcomes in the sample space which compose the event.	-Probabilities of Compound Events	
7.SP.8c	Design/use a simulation to generate frequencies for compound events. For example, use random digits as a simulation tool to approximate the answer to the question: If 40% of donors have type A blood, what is probability that it will take at least 4 donors to find one with type A blood?

The Number System: 8.NS - Know that there are numbers that are not rational, and approximate them by rational numbers.			
8.NS.1	Know that numbers that are not rational are called irrational. Understand informally that every number has a decimal expansion; for rational numbers show that the decimal expansion repeats eventually, and convert a decimal expansion which repeats eventually into a rational number.	-Convert to Rational Numbers	
8.NS.2	Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line diagram, and estimate the value of expressions (e.g. π^2). For example, for the approximation of 68, show that $\sqrt{68}$ is between 8 and 9 and closer to 8.	-Estimate Irrational Numbers	
Expressions and Equations: 8.EE - Work with radicals and integer exponents.			
8.EE.1	Use square root and cube root symbols to represent solutions to equations of the form $x^2=p$ and $x^3=p$, where p is a positive rational number. Evaluate square roots of whole number perfect squares with solutions between 0 and 15 and cube roots of whole number perfect cubes with solutions between 0 and 5. Know that $\sqrt{2}$ is irrational.	-Square and Cube Roots	
8.EE.2	Use numbers expressed in the form of a single digit times an integer power of 10 to estimate very large or very small quantities, and to express how many times as much one is than the other. For example, estimate the population of the United States as 3×10^8 and the population of the world as 7×10^9 , and determine that the world population is more than 20 times larger.	-Scientific Notation	
8.EE.3	Read and write numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g. use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology.	-Scientific Notation: Operations

Expressions and Equations: 8.EE - Understand the connections between proportional relationships, lines, and linear equations.			
8.EE.4	Graph proportional relationships, interpreting its unit rate as the slope (m) of the graph. Compare two different proportional relationships represented in different ways. For example, compare a distance-time graph to a distance-time equation to determine which of two moving objects has greater speed.	-Relationships and Slope	
8.EE.5	Use similar triangles to explain why the slope (m) is the same between any two distinct points on a non-vertical line in the coordinate plane and extend to include the use of the slope formula ($m=(y_2-y_1)/(x_2-x_1)$) when given two coordinate points (x_1, y_1) and (x_2, y_2). Generate the equation $y=mx$ for a line through the origin (proportional) and the equation $y=mx+b$ for a line with slope m intercepting the vertical axis at y -intercept b (not proportional when $b \neq 0$).	-Slope Intercept Form, Triangles	
8.EE.6	Describe the relationship between the proportional relationship expressed in $y=mx$ and the non-proportional linear relationship $y=mx+b$ as a result of a vertical translation.		
Expressions and Equations: 8.EE - Analyze and solve linear equations, and inequalities.			
8.EE.7	Fluently (efficiently, accurately, and flexibly) solve one-step, two-step, and multi-step linear equations and inequalities in one variable, including situations with the same variable appearing on both sides of the equal sign.	-Solutions to Linear Equations	
8.EE.7a	Give examples of linear equations in one variable with one solution ($x=a$), infinitely many solutions ($a=a$), or no solutions ($a=b$). Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x=a, a=a, \text{ or } a=b$ results (where a and b are different numbers).	-Solutions to Linear Equations	
8.EE.7b	Solve linear equations and inequalities with rational number coefficients, including equations/inequalities whose solutions require expanding and/or factoring expressions using the distributive property and collecting like terms.	-Solutions to Linear Equations

Functions: 8.F - Define, evaluate, and compare functions.			
8.F.1	Explain that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output.		
8.F.2	Compare properties of two linear functions represented in a variety of ways (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a linear function represented by a table of values and a linear function represented by an algebraic expression, determine which function has the greater rate of change, the greater y-intercept, or the point of intersection.		
8.F.3	Interpret the equation $y=mx+b$ as defining a linear function, whose graph is a straight line; give examples of functions that are not linear. For example, the function $A=s^2$ giving the area of a square as a function of its side length is not linear because its graph contains the points (1,1), (2,4) and (3,9), which are not on a straight line.		
Functions: 8.F - Use functions to model relationships between quantities.			
8.F.4	Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two (x, y) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values.		
8.F.5	Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g. where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally.		
Geometry: 8.G - Understand concepts of angle and measure angles.			
8.G.1	Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement:		

KS Code	Kansas Standard	Quest Title	Small Group Skill Lesson
8.G.1a	An angle is measured with reference to a circle with its center at the common endpoint of the rays, by considering the fraction of the circular arc between the points where the two rays intersect the circle. An angle that turns through $\frac{1}{360}$ of a circle is called a “one-degree angle,” and can be used to measure angles.		
8.G.1b	An angle that turns through n one-degree angles is said to have an angle measure of n degrees.		
8.G.2	Measure angles in whole-number degrees using a protractor. Draw angles of specified measure using a protractor and straight edge.	-Measuring Angles	
8.G.3	Recognize angle measure as additive. When an angle is decomposed into non-overlapping parts, the angle measure of the whole is the sum of the angle measures of the parts. Solve addition and subtraction problems to find unknown angles on a diagram in real world and mathematical problems, e.g. by using an equation with a symbol for the unknown angle measure.	-Additive Angles	
8.G.4	Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and use them to solve simple equations for an unknown angle in a figure.		
8.G.5	Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the angle-angle criterion for similarity of triangles. For example, arrange three copies of the same triangle so that the sum of the three angles appears to form a line, and give an argument in terms of transversals why this is so.		
8.G.6	Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on drawing triangles from three measures of angles or sides, noticing when the conditions determine a unique triangle, more than one triangle, or no triangle.		
Geometry: 8.G - Understand and apply the Pythagorean Theorem.			
8.G.7	Explain a proof of the Pythagorean Theorem and its converse.		

KS Code	Kansas Standard	Quest Title	Small Group Skill Lesson
8.G.8	Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions. For example: Finding the slant height of pyramids and cones.		
8.G.9	Apply the Pythagorean Theorem to find the distance between two points in a coordinate system.		
Geometry: 8.G - Solve real-world and mathematical problems involving volume of cylinders, cones, and spheres.			
8.G.10	Investigate the relationship between the formulas of three dimensional geometric shapes;		
8.G.11a	Generalize the volume formula for pyramids and cones ($V = \frac{1}{3} Bh$).		
8.G.11b	Generalize surface area formula of pyramids and cones ($SA = B + \frac{1}{2} Pl$).		
8.G.12	Solve real-world and mathematical problems involving arc length, area of two-dimensional shapes including sectors, volume and surface area of three-dimensional objects including pyramids, cones and spheres.		
Statistics and Probability: 8.SP - Investigate patterns of association in bivariate data.			
8.SP.1	Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns such as clustering, outliers, positive or negative association, linear association, and nonlinear association.	-Construct, Explain Scatter Plots	
8.SP.2	Know that straight lines are widely used to model relationships between two quantitative variables. For scatter plots that suggest a linear association, informally fit a straight line, and informally assess the model fit by judging the closeness of the data points to the line.	-Line of Best Fit	
8.SP.3	Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. For example, in a linear model for a biology experiment, interpret a slope of 1.5 cm/hr as meaning that an additional hour of sunlight each day is associated with an additional 1.5 cm in mature plant height.
